	Transactions are fully encrypted which assures a private transaction exchanged between the sender and receiver.
	This system does not anonymize your IP and a VPN is recommended for IP address privacy.
	If both wallets are online when a transaction is created, the process takes place immediately.
	sender is online.
	The receiver signs the transaction and responds with a confirmation back to the sender which 'finalizes' the transaction if the
	Transactions are sent to the Epicbox server and delivered to the recipient as soon as the receiver's wallet is online.
	How it works:
	Relay servers such as epicbox.epic.tech and others to come later are provided by our community.
	This is accomplished securely and privately by using an external relay server called "Epicbox"
	EPIC addresses provide an easy way to send EPIC when the receiving wallet is offline.

27. Click on Save and Finish.

28. The external node is not synched with its peer nodes. That's OK. Let's move on to the next step.
